Dyadic coping and attachment
[2010]-[2011]

**Research group:** Raffaella Iafrate, Anna Bertoni, Silvia Donato
**Partner:** Prof. Guy Bodenmann, Università di Zurigo.

**Abstract**
The objective of the research study was to investigate the link between dyadic coping, commitment, marital satisfaction and attachment. The study collected over 300 couples: one hundred couples were collected in Italy, one hundred in Switzerland (in collaboration with Prof. Bodenmann of the University of Zurich) and one hundred from Germany (in collaboration with Dr. Dinkel of the University of Dresden). The self-report questionnaire was made up of the following scales: Dyadic Adjustment Scale (Spanier, 1976), Dyadic Coping Inventory (Bodenmann, 1997; Donato, Iafrate, Barni, Bertoni, Bodenmann e Gagliardi, 2009); a reduced version of the Big Five Inventory (Rammstedt & John, 2005); Commitment Level Items (CIL; Rusbult et al., 1998); Experiences in Close Relationships (ECR; Brennan, Clark & Shaver, 1998). Analyses of the data are currently in progress.
